## **EXECUTIVE SUMMARY**

An Extraction, Scrub, and Strip (ESS) test was performed on the qualification sample from the second lot of Caustic-Side Solvent Extraction (CSSX) solvent for the Salt Waste Processing Facility (SWPF). Testing used simulated salt solution to determine cesium distribution ratios ( $D_{(Cs)}$ ), and cesium concentration in the strip effluent (SE) and decontaminated salt solution (DSS) streams. This data will be used by Parsons to help determine if the solvent is qualified for use at the SWPF.

The ESS test showed acceptable performance of the solvent for extraction, scrub, and strip operations. The extraction  $D_{(Cs)}$  measured 14.4, exceeding the required value of 8. This value is consistent with results from previous ESS tests using similar solvent formulations. Similarly, scrub and strip cesium distribution ratios fell within acceptable ranges.

TOA	Trioctylamine
TTQAP	Task Technical and Quality Assurance Plan

## 1.0 Introduction

This report provides information on the testing of CSSX solvent for use in the Salt Waste Processing Facility.

Provided are the distribution ratios for cesium ( $D_{(Cs)}$ ) and the cesium concentrations in the SE and DSS streams obtained from performance of an Extraction, Scrub, Strip (ESS) test using the prepared solvent and a salt simulant provided by Parsons. This work was specified in a Technical Task Request<sup>i</sup> and in a Task Technical and Quality Assurance Plan (TTQAP).<sup>ii</sup> Details of the work are contained in controlled laboratory notebooks.<sup>iii</sup>

## 2.0 Experimental Procedures

### 2.1 ESS Testing

For the ESS test, Parsons provided the salt simulant and the as-weighed composition (LABCS-SSFS-002aRW09).<sup>iv</sup> SRNL added a de minimis volume of  $^{137}\text{Cs}$  source to make the parent solution radioactivity  $\sim 1\text{E}+06$  dpm/mL, a goal value to provide enough radioactivity for ease of measurement while providing minimal dose to personnel. See Table 1 for the composition of this material. This is the same procedure used as in the previous Parsons solvent ESS test.<sup>v</sup>

**Table 1. Composition of the Parsons Salt Simulant (LABCS-SSFS-002aRW09)**

Analyte	Molarity (M)	Analyte	Molarity (M)
$\text{Na}^+$	6.37	$\text{AlO}_2^-$	0.251
$\text{K}^+$	0.0150	$\text{C}_2\text{O}_4^{2-}$	7.99E-03
$\text{Cs}^+$ (cold)	4.10E-04	$\text{PO}_4^{3-}$	5.18E-03
$\text{Zn}^{2+}$	1.24E-04	$\text{MoO}_4^{2-}$	7.86E-05
$\text{Sr}^{2+}$	1.05E-04	$\text{NO}_3^-$	2.21
$\text{Cu}^{2+}$	2.66E-05	$\text{NO}_2^-$	0.600
$\text{Sn}^{2+}$	2.10E-05	$\text{Cl}^-$	2.94E-02
Free $\text{OH}^-$	2.55	$\text{SO}_4^{2-}$	0.168
$\text{CO}_3^{2-}$	0.180	$\text{F}^-$	3.36E-02
Density	1.266 g/mL (21.1 °C)	$^{137}\text{Cs}$ (nominal)	1E+06 dpm/mL

The analytical uncertainty for the cation and anions are 10%. The analytical uncertainty for the  $^{137}\text{Cs}$  is 5%.

The test used the standard protocol for analyzing macrobatch salt waste as formalized in a SRNL manual.<sup>vi</sup> The test used a nominal starting volume of 90 mL of salt simulant feed and 30 mL (3:1

aqueous-to-organic volume ratio) of freshly prepared CSSX solvent.<sup>a</sup> This solvent was supplied by Marshallton Research Laboratories, Inc., under contract to Parsons. The sample is identified as CSSX-2017-3 and was used without further alteration or analysis. The density of this solvent was measured as 0.852 g/mL at 17.8 °C which matches the nominal value of 0.852 g/mL.<sup>vii</sup> The scrub and strip solutions were 0.05 M nitric acid and 0.001 M nitric acid, respectively, and used an organic to aqueous volume ratio of 5:1.

## 2.2 Quality Assurance

Requirements for performing reviews of technical reports and the extent of review are established in Manual E7, Procedure 2.60.<sup>viii</sup> SRNL documents the extent and type of review using the SRNL Technical Report Design Checklist contained in WSRC-IM-2002-00011, Rev. 2.<sup>ix</sup>

## 3.0 Results and Discussion

Table 2 shows the results from the ESS test, corrected to the normal process operating temperatures (i.e., 23 °C for extraction and scrub and 33 °C for strip). For these tests, the temperature correction factors for the CSSX solvent were used (see Appendix). For comparison, the acceptable range of values are provided.<sup>vii</sup>

The temperature in the shaker oven during the ESS test ranged from 22.3 °C to 25.0 °C for the extraction and scrub steps and 32.0 °C to 32.3 °C for the strip steps.

**Table 2. Cesium Distribution Ratios ( $D_{(Cs)}$ ) for the ESS Tests**

Material	Extraction	Scrub#1	Scrub#2	Strip#1	Strip#2	Strip#3
Acceptable Range	>8	>0.6, <2	>0.6, <2	<0.2	<0.16	<0.16
This Test	14.4	1.19	0.83	0.0499	0.0281	0.0196

The current test shows the expected behaviors, with good overall performance. The measured strip distribution values are as much as ~8 times better than the maximum threshold values indicating excellent stripping behavior.

## 3.1 Aqueous and Organic Phase Results

At the end of the ESS test, the gamma activities of each phase, and the pH of the aqueous phases were measured (Table 3).

**Table 3. Aqueous and Organic Phase  $^{137}\text{Cs}$  Results**

<sup>a</sup> The CSSX solvent has a composition as follows: 0.007 M BOBCalixC6 [calix[4]arene-bis(*tert*-octylbenzo-crown-6)], 0.75M Cs-7SB Modifier [1-(2,2,3,3-tetrafluoropropoxy)-3-(4-sec-butylphenoxy)-2-propanol], 0.003 M trioctylamine (TOA), and the balance Isopar™ L. This formulation should not be confused with other, more recent iterations used at the Modular Caustic Side Solvent Extraction Unit (MCU).

<b>Sample</b>	<b>AQ <math>^{137}\text{Cs}</math> (dpm/mL)</b>	<b>ORG <math>^{137}\text{Cs}</math> (dpm/mL)</b>	<b>AQ pH</b>
Salt Simulant Feed	3.84E+05	0	14
Extraction	6.21E+04	9.39E+05	14
Scrub#1	6.93E+05	8.15E+05	4.0
Scrub#2	9.78E+05	6.63E+05	3.0
Strip#1	2.86E+05	1.58E+05	3.0
Strip#2	8.06E+05	2.49E+04	3.0
Strip#3	1.28E+05	2.70E+03	3.0

The 1- $\sigma$  analytical uncertainty on the  $^{137}\text{Cs}$  activity is 5%. The analytical uncertainty is  $\pm 1$  pH unit for the pH measurement performed with colorimetric strips. The pH results from the test are comparable to values from prior testing.

#### 4.0 Conclusions

Results of the ESS test for this prepared solvent sample meet the performance expectations. There is no unexpected behavior and there are no anticipated issues for cesium removal.

## Appendix. Temperature Correction Factors for the ESS Tests

The SWPF facility uses active temperature control to keep the extraction and scrub steps at 23 °C, and the strip steps at 33 °C. The temperature during the ESS tests varied slightly over the course of the experiment within the control bands of the system used. During each step of an ESS test, the calculated distribution values must be corrected for temperature. The general formula for temperature correction is as follows:

$$\text{correction factor} = \text{EXP}((\text{COEF}/0.0083144)*((1/\text{TEMP})-(1/(\text{STEP})))) \quad (\text{Eqn. 1})$$

where “COEF” is the particular temperature coefficient (i.e., apparent enthalpy change) for the stage in question, “TEMP” is the ambient temperature, in Kelvin, and “STEP” is 296.15 for extraction and scrub and 306.15 for strip stages.

Table 4 lists the temperature coefficients for each step in an ESS test, as well as the actual temperature measured during the test.

**Table 4. Temperature Coefficients**

Stage	BOBCalixC6 <sup>vii</sup>	Temperature (±0.5 °C)
Extraction	-47.95	22.3
Scrub#1	-86.82	23.1
Scrub#2	-74.24	25.0
Strip#1	-79.36	32.0
Strip#2	-82.94	32.1
Strip#3	-82.49	32.3
